## **1) Abstract**

This research measures the impact of UEFA club competitions on results achieved by participating teams at domestic league level. During the two competition cycles analysed (2009/10 to 2011/12; 2012/13 to 2014/15), there is evidence that European Cup participation did not have a negative impact on domestic league performance. This is valid for all three of the temporal perspectives analysed.

From a long-term standpoint (over a whole season), the analysis shows that the vast majority of clubs participating in the group stage of UEFA club competitions qualify for at least the preliminary rounds of the next edition. Throughout the six-year period considered, 77.7% of group stage participants qualified to European Cups in the following season: 90.6% for Champions League teams and 69.1% for Europa League clubs.

From a medium-term perspective (between semesters of the same season), the analysis of results between semesters of the same season shows that elimination from European Cups does not have a positive impact on results achieved at domestic league. On the contrary, clubs tend to obtain a lower number of points per match after elimination. However, from a statistical standpoint, the gaps measured are again not significant.

From a short-term perspective (for matches before or after European Cup games), the study highlights that teams achieve similar results at domestic league level whether or not UEFA competition fixtures take place within a five-day period before or after championship matches. . As for previous analysis, this finding confirms that there is no negative impact of European Cups on domestic league results.

The study shows that, from a scientific perspective, explaining defeats at domestic league level by referring to psychological or physical fatigue generated by participation in UEFA club competitions is not a valid argument.

## **2) Introduction**

This report is an update of the analysis already undertaken by the CIES Football Observatory academic team on behalf of UEFA for the three-season period between 2009/10 and 2011/12. The goal of the research was to assess the impact of participation in UEFA club competitions (Champions League and Europa League) on domestic league results.

The study focuses on the representatives of the 15 most competitive national associations. It covers the six-season period between 2009/10 and 2014/15. A distinction is made between the first three seasons of the period (first competition cycle) and the last three (last competition cycle). The study also allows readers to distinguish between the Champions League and the Europa League.

Moreover, clubs were split into three categories according to the sporting strength of the national association to which they belong: first tier (England, Spain, Germany and Italy), second tier (France, Portugal, Netherlands, Russia and Ukraine) and third tier (Turkey, Greece, Belgium, Denmark, Switzerland and Austria).

The analysis of the impact of European Cup participation on performance at domestic league level is undertaken from a triple temporal perspective:

- long-term: points per match over a whole season with or without participation in UEFA club competitions and according to number of international fixtures
- medium-term: points per match before and after elimination from UEFA club competitions
- short-term: points per match with or without UEFA club competition fixtures within five days

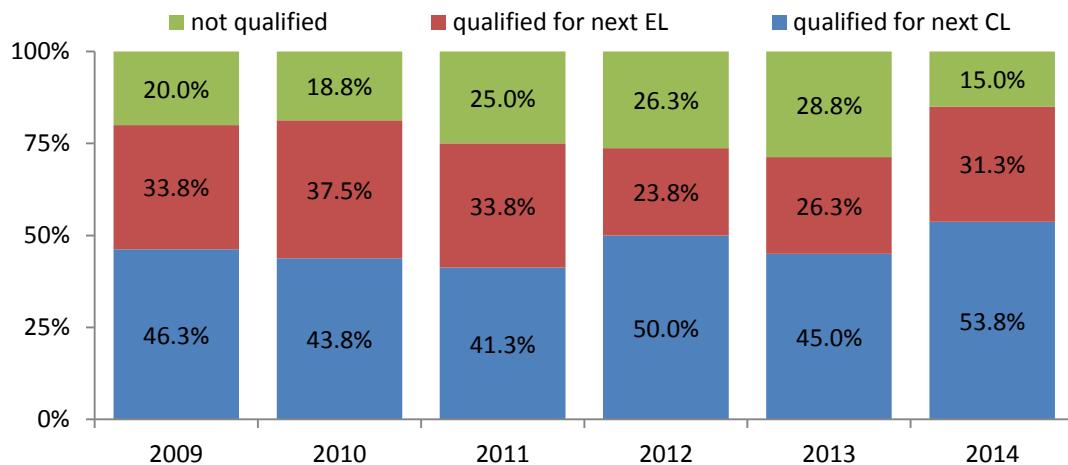

The findings are presented following the same logic from the long-term to the short-term temporality. The conclusion sums up the key results and can be read as an executive summary.

### 3) Long-term impact

A first possible approach to measure the long-term effect of participation in UEFA club competitions consists of analysing the proportion of teams qualified for the group stage that also qualified for at least the preliminary rounds in the following season. Figure 1 below shows that group stage participation did not prevent the vast majority of clubs from all UEFA national associations from qualifying to UEFA club competitions for the next season.

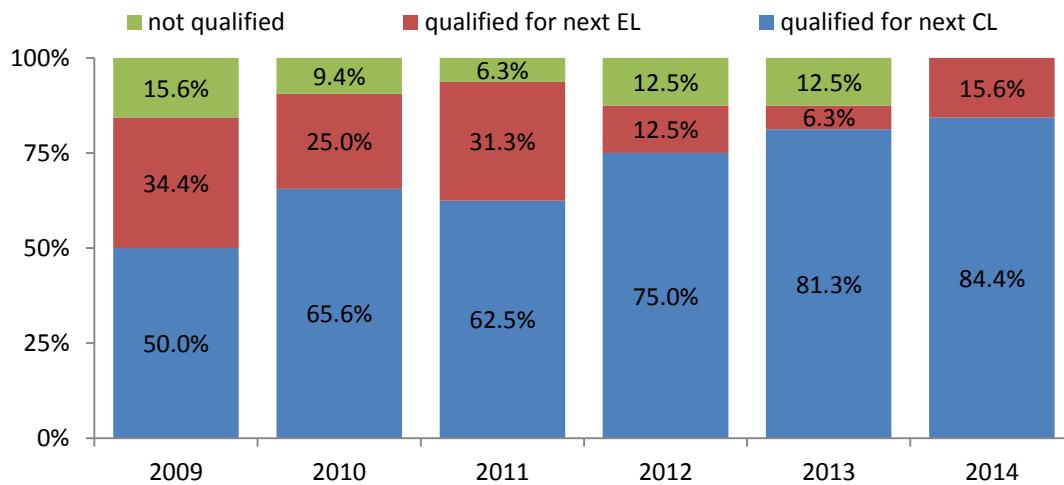

The percentage of teams who qualified for the next edition varies between 71.2% in 2013/2014 and 85.0% in 2014/2015. This percentage is also high if we only consider representatives of the 15 most competitive national associations: from 66.1% in 2013/14 to 81.2% in 2010/11.

*Figure 1: percentage of group stage participants qualified to UEFA club competitions in the following season (2009/10-2014/15)*

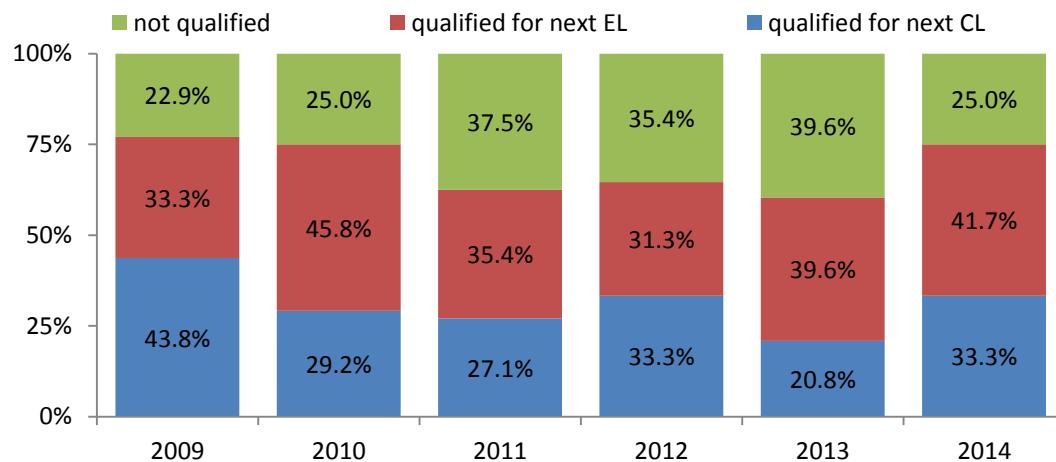

The average percentage of teams qualified for the next season among Champions League group stage participants is over 90%. For the first time during the six-season period analysed, all teams in the 2014/15 Champions League group stage qualified for at least the preliminary stages of a UEFA club competition in 2015/16. The lowest level was recorded between 2009/10 and 2010/11: 84.4% (Figure 2).

*Figure 2: percentage of Champions League group stage participants qualified to UEFA club competitions in the following season (2009/10-2014/15)*

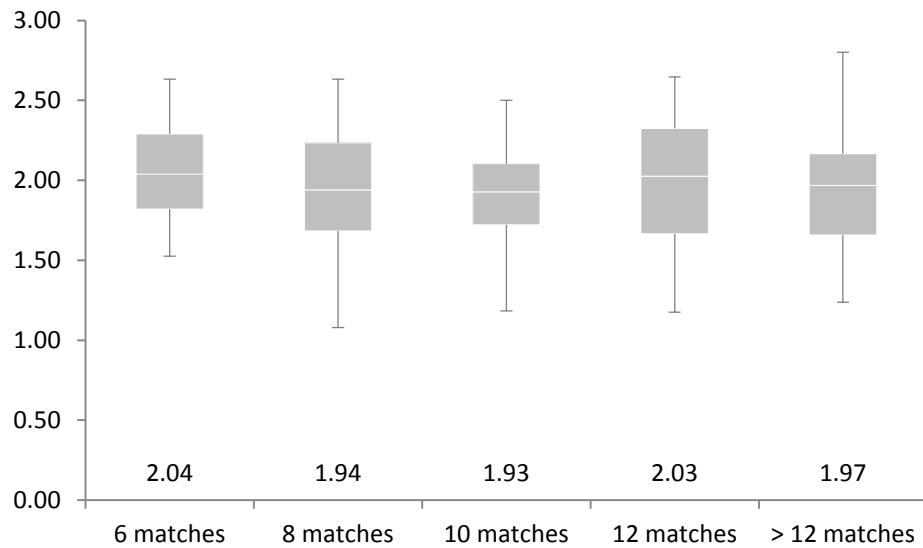

While generally lower than at Champions League level, the percentage of Europa League group stage participants qualified for European Cups during the following season was always over 60% (figure 3). The average percentage for the six years analysed was 69.1% for all clubs and 63.6% for representatives of the 15 most competitive national associations.

*Figure 3: percentage of Europa League group stage participants qualified to UEFA club competitions in the following season (2009/10-2014/15)*

A second possible approach to measure the long-term impact of participation in European Cups on domestic league results consists of testing the link between the number of matches played in UEFA club competitions and the points per match obtained in national championships during a given season. For more robustness, only teams that took part in at least four European Cup editions from 2009/10 to 2014/15 are included in the analysis. Globally, 51 clubs are in this situation. Appendix 1 presents the data at club level.

*Figure 4: number of matches in UEFA club competitions and points per match in the domestic league (2009/10-2014/15)*

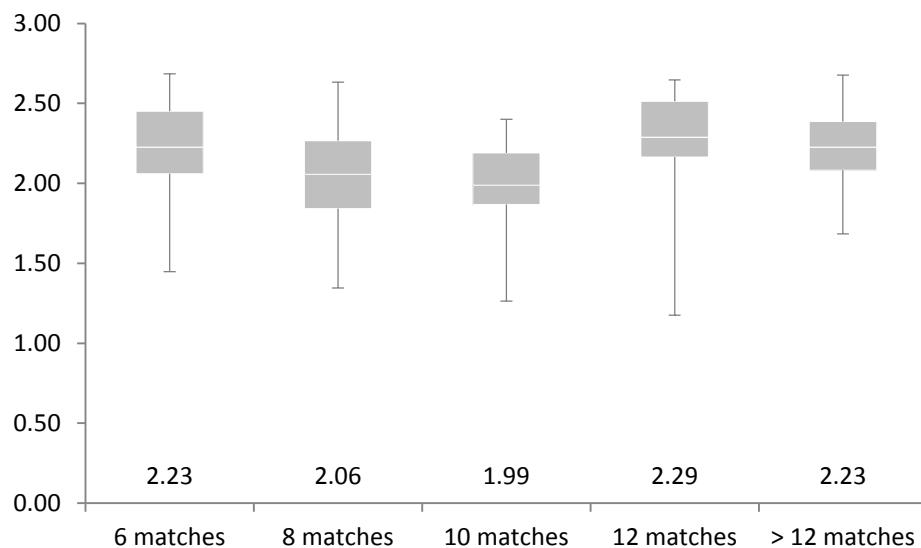

This analysis shows that there is no correlation between the number of games played during a season in UEFA club competitions and results achieved at domestic league level. Indeed, the average number of points per match achieved by European Cup participants is very similar regardless of the number of matches played at international level: from 1.93 to 2.04.

While the number of international fixtures can sometimes affect domestic league results, the opposite also holds true. For example, while Chelsea FC recorded the lowest number of points per match in the domestic league in 2011/12 (1.68) when it played the most games in European Cups (13), FC Porto obtained the highest level of points per match in the Portuguese championship (2.8) the same season (2010/11) when they played the most matches in UEFA club competitions (17).

Further analysis focusing on clubs that participated in at least four Champions League editions out of six from 2009/10 to 2014/15 confirms that no significant difference in domestic league performance exists according to the number of games played in the competition. For example, clubs having played over 12 Champions League matches during a given season obtained as many points at domestic league level as teams that only played 6 games in the competition.

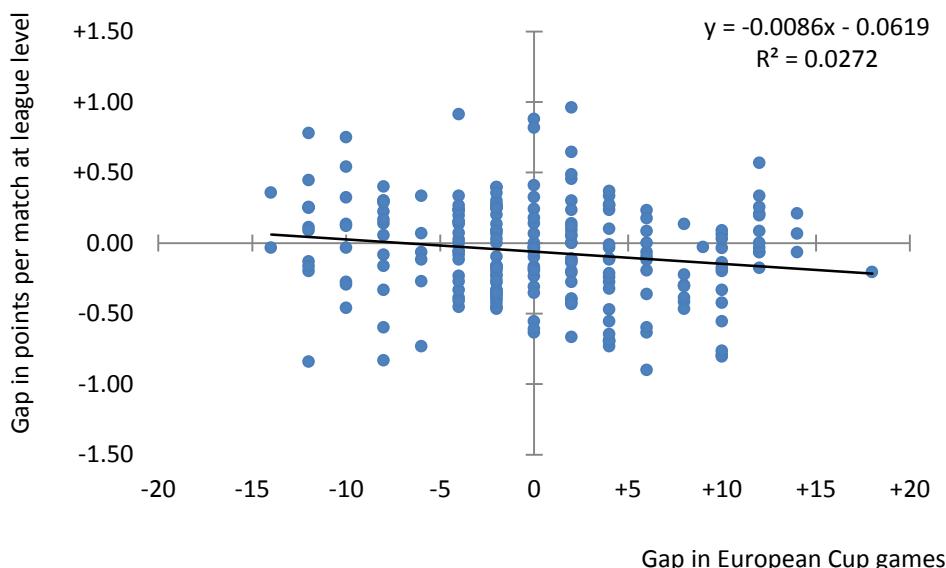

*Figure 5: number of Champions League games and points per match in the domestic league (2009/10-2014/15)*

A third possible approach to measure the long-term impact of UEFA club competitions on national league results is to test the correlation between the gap in the number of matches played in European Cups between two successive seasons and the gap in points per match achieved at league level during the same period.

This specific analysis allows us to determine if the increase in the number of international matches has a negative impact on domestic league performance or, respectively, if a decrease has a positive effect. Only successive seasons during which a club qualified at least once for UEFA club competitions were included in the analysis.

*Figure 6: correlation between the gap in European Cup matches and the gap in points per match at league level between successive seasons (2009/10-2014/15)*

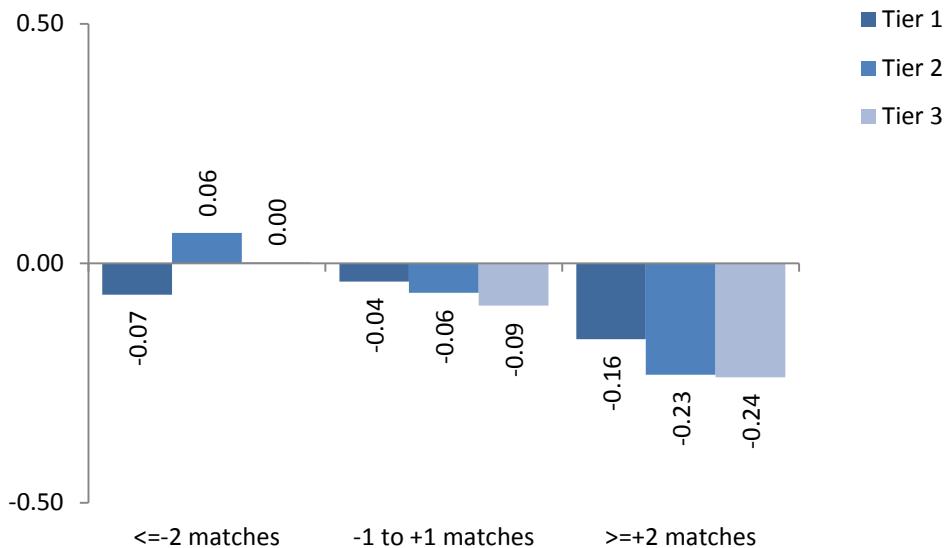

The scatter plot shows that clubs tend to obtain more points per match in their national league when they played a fewer number of European Cup matches compared to the previous season or when they played a greater number of games in the following season. However, from a statistical standpoint, the difference is not significant.

The only significant gap was measured for teams having played at least two more games in the Champions League during a season compared to the previous or following season. This is mainly due to a sub-sample of clubs for which qualification in the group stage of the Champions League is a rare event: Austria Wien in 2013/14 (+10 matches compared to 2012/13, -0.81 points per match at league level), Montpellier in 2012/13 (+6, -0.79), RC Genk in 2011/12 (+10, -0.60) or SC Braga in 2010/11 (+10, -0.83).

This finding may be interpreted as a tendency for teams and players who do not regularly participate in the Champions League group stage to focus their efforts on international fixtures to the detriment of domestic league matches. Moreover, many teams for which Champions League qualification or success can be considered as an overachievement tend to lose their best players during the summer transfer window following this success.

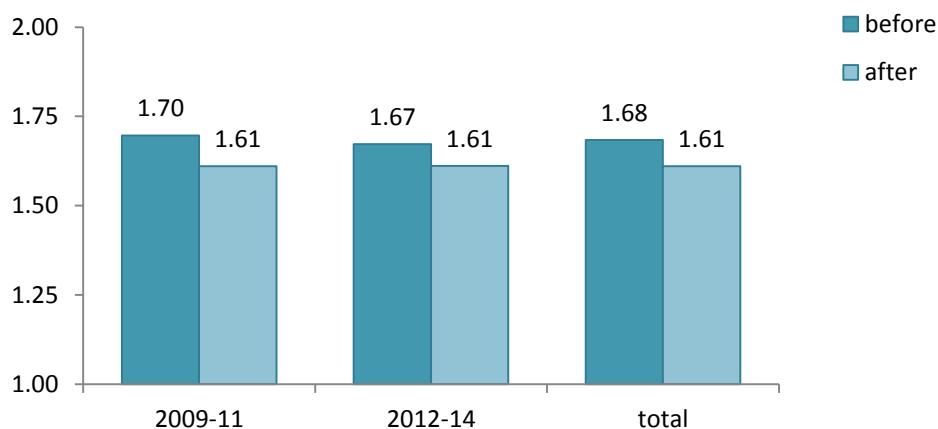

*Figure 7: gap in Champions League games and gap in points per match at league level between successive seasons, per association tier (2009/10-2014/15)*

#### 4) Medium-term impact

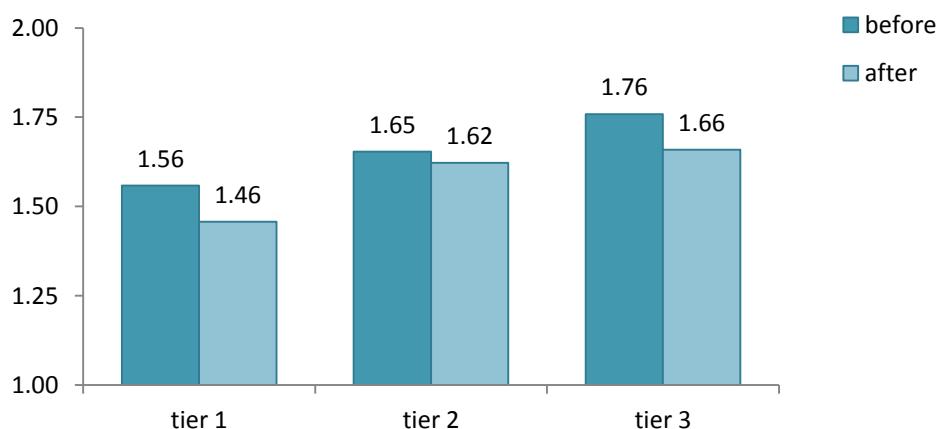

A first possible approach to determine the medium-term impact of participation in UEFA club competitions on domestic league results consists of comparing the points per match achieved in the latter competition before and after the elimination from the former. This analysis is undertaken on clubs who belong to the 15 best ranked national associations that were eliminated from all European Cups after the end of the group stage in December of the six seasons surveyed.

*Figure 8: points per match in domestic leagues before and after elimination from UEFA club competitions*

This analysis shows that elimination from European Cups does not have a positive impact on results achieved in the national league. On the contrary, clubs tend to obtain a lower number of points per match after elimination. However, the gap is statistically not significant. A slight worsening in domestic league results after elimination from European club competitions was recorded for representatives of all national association categories.

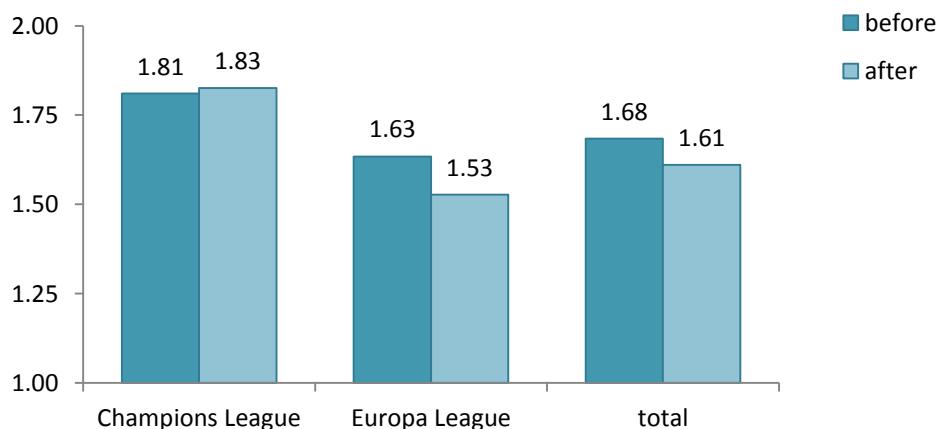

*Figure 9: points per match in domestic leagues before and after elimination from UEFA club competitions, per national association category (2009/10-2014/15)*

Contrary to arguments based on fatigue being generated by UEFA club competitions, elimination from the latter tends to have a negative effect on domestic league performance when compared to performance during participation in the competition. This surprising result may be related to the fact that participation in European Cups is a key motivation factor for players and elimination may unconsciously provoke a loss in personal involvement for the rest of the season. Another possible explanation is the difficulty for coaches to manage large squads with fewer games to be played.

The analysis according to the type of European Cup competition shows that clubs eliminated from the Champions League (not including teams still qualified for Europa League) tend to maintain the same level of results in the second part of the season. This is not the case for teams eliminated from the Europa League. However, the differences observed are not statistically significant.

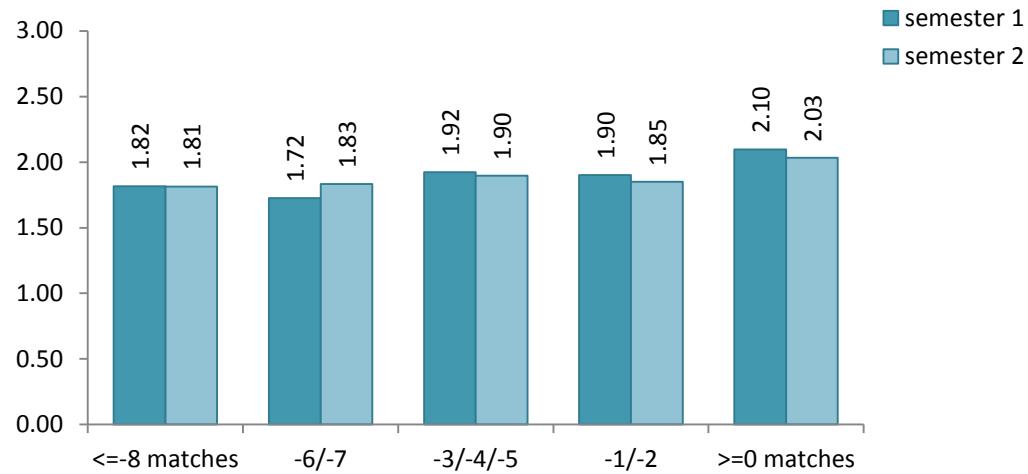

*Figure 10: points per match in domestic leagues before and after elimination from UEFA club competitions, Champions League and Europa League (2009/10-2014/15)*

A second possible approach to measure the medium-term impact is to test the correlation between the gap in the number of matches played in UEFA club competitions between the first and the second semester of a season and the gap in points per match achieved at domestic league level. This analysis permits us to determine if the decrease in the number of international matches leads to better results in national championships.

This analysis was undertaken on all clubs of the 15 national associations reviewed and who had participated in the Champions League and/or Europa League during the six-season period considered, regardless of if they reached the group stage of the competition.

*Figure 11: gap in the number of matches played in UEFA club competitions and gap in points per match in domestic league from 1<sup>st</sup> to 2<sup>nd</sup> semester (2009/10-2014/15)*

This analysis confirms that the general decrease in the number of international matches during the second semester of a season does not have a positive effect on domestic league results. This finding shows that the vast majority of teams are unable to take advantage of early elimination from UEFA club competitions to improve their efficiency at national championship level. This is valid for teams eliminated from the Champions League, as well as for clubs eliminated from the Europa League.

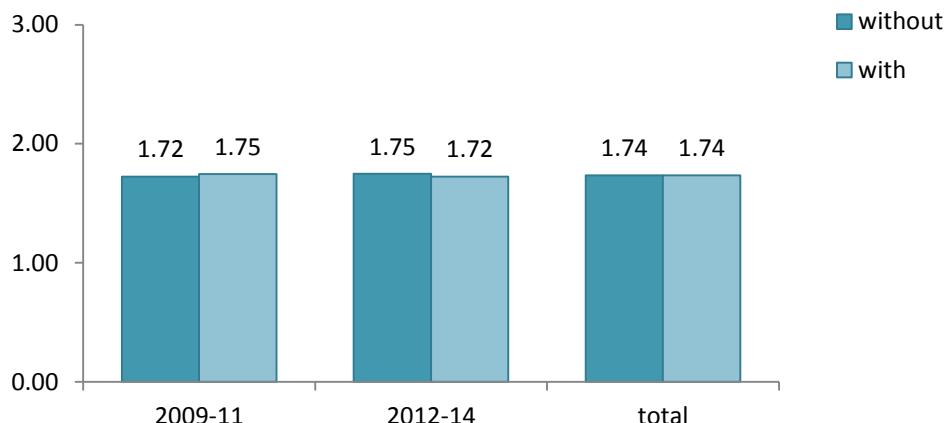

## 5) Short-term impact

A first possible approach to measure the short-term impact of European Cup fixtures is to compare the results achieved in domestic leagues when a UEFA competition match was played before or after no more than five days from a national championship game and results when this was not the case. Indeed, one might expect that in the first case in point, physical and/or psychological aspects have a negative impact on performance.

To avoid the bias related to the fact that the best performing teams tend to play more matches in European Cups and would be over-weighted in the calculations, the following data refers to club averages. This allows us to give the same weight to each team, regardless of the number of domestic league games played within five days of UEFA competition matches throughout a season.

We also carried out the analysis by not including teams who had only played a few number of domestic league games within five days of European Cup fixtures (<5, <10, < 15). The findings are fully consistent with those reported below. Appendix 2 presents the data at club level.

*Figure 12: points per match in domestic league with or without European Cup games within five days before or after championship matches*

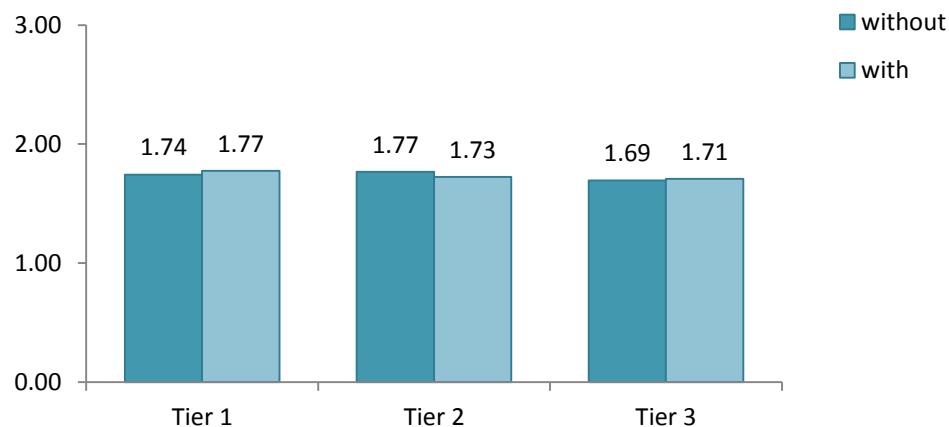

Teams achieve almost equal results in their respective league regardless of if UEFA competition fixtures take place within a five-day period before or after championship matches. This analysis shows that there is no negative impact from European Cups on domestic league results from a short-term perspective.

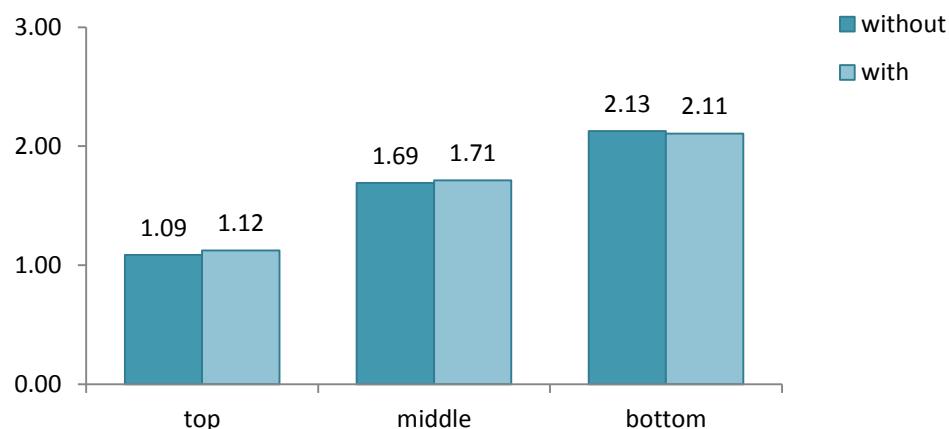

This finding holds true irrespective of national association category (figure 16), strength of opponent clubs defined using three levels (top, middle bottom) according to points per match achieved at the end of the season ( $>1.7$ ,  $1.2-1.7$ ,  $<1.2$ ) (figure 17), domestic league match

venue (home, away) (figure 18) and type of European Cup competition (Champions League, Europa League) (figure 19).

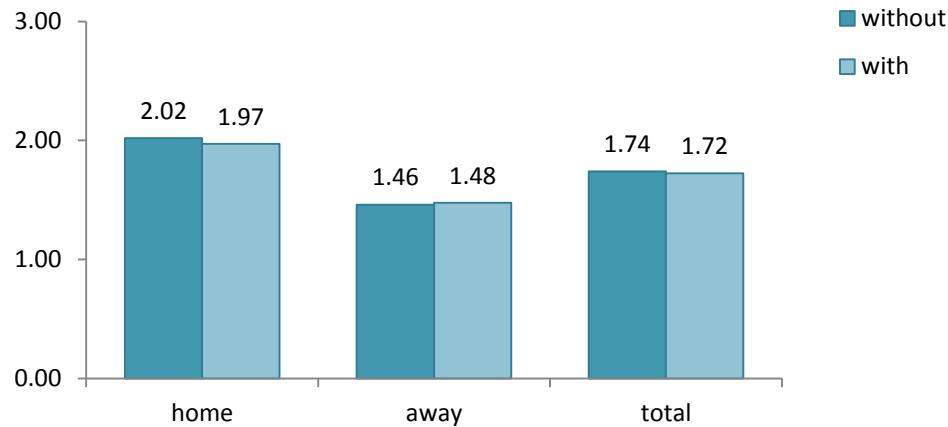

*Figure 13: points per match in domestic league with or without European Cup games within five days before or after championship matches, per national association category (2009/10-2014/15)*

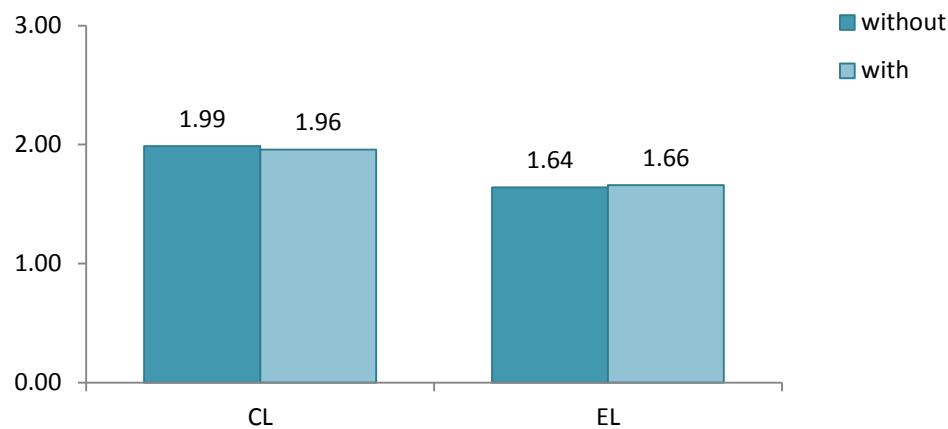

*Figure 14: points per match in domestic league with or without European Cup games within five days before or after championship matches, per strength of opponent clubs (2009/10-2014/15)*

*Figure 15: points per match in domestic league with or without European Cup games within five days before or after championship matches, per venue of the league fixture (2009/10-2014/15)*

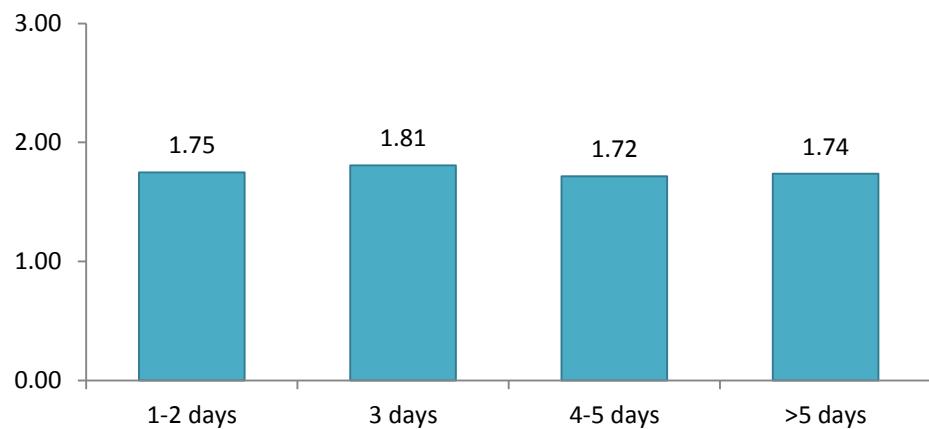

*Figure 16: points per match in domestic league with or without European Cup games within five days before or after championship matches, per type of UEFA club competition (2009/10-2014/15)*

A further analysis consists of looking at the points per match achieved by clubs according to the number of full recovery days between matches in UEFA club competitions and national championship games. It confirms that European Cup participants do not perform better in domestic leagues when no international fixtures are scheduled within five days.

Clubs obtain the best domestic league results when they only have three full recovery days before or after UEFA club competition games: 1.81 points per match compared to 1.74 without European Cup fixtures within five days. The same finding was observed when not including clubs who did not play at least three matches per recovery period. This confirms the robustness of the results. Again, the gaps are not statistically significant.

*Figure 17: points per match in domestic league, per full recovery days from the closest international fixture (2009/10-2014/15)*

## **6) Conclusion**

The study shows that participation in UEFA club competitions does not have a negative impact on domestic league results. This holds true for all three of the temporal perspectives analysed: long-term (over a whole season), medium-term (before and after elimination during the same season) and short-term (for matches preceding or following international fixtures).

Over a season, the analysis indicates that almost four clubs participating in the group stage of UEFA club competitions out of five qualify for at least the preliminary stage of the next edition. This percentage is particularly high for Champions League teams: 90.6%. However, it is also close to 70% for Europa League participants.

The medium-term analysis focusing on results between semesters of the same season also shows that elimination from European Cups does not have a positive impact at domestic league level. On the contrary, clubs tend to obtain fewer points per match after elimination. However, from a statistical standpoint, the gaps measured are again not significant for both competition cycles.

From a short-term perspective, the study indicates that teams achieve equivalent results at domestic league level regardless of UEFA competition fixtures taking place within a five-day period before or after championship matches. As for previous analysis, this finding confirms that there is no negative impact from European Cups on domestic league results. This is also valid for both competition cycles analysed.

Finally, the research shows that explaining defeats at domestic league level by referring to psychological or physical fatigue generated by participation in UEFA club competitions cannot be considered as a valid argument from a scientific perspective.
